Kaapi Corner - Local Launch Campaign Report

A flyer, an SEO landing page and a Google Ads campaign for a neighbourhood coffee shop

EXAMPLE REPORT. This shows the sections and the level of detail the Capstone agent expects. Your own .docx report needs exactly three sections: **Problem Statement**, **Approach** and **Conclusion**. Do not paste your page code or screenshots into it: the landing page's files, the flyer, your campaign files and your screenshots (the page, Google Ads setup, GA4 dashboard) all go in the .zip, the screenshots in its **output_screenshots** folder. Write about your own project; do not copy this one.

Problem Statement

Kaapi Corner is a new filter-coffee shop on DB Road, RS Puram, Coimbatore. It has no website, no online reviews and no way to tell which of its promotions bring people in. The owner wants more first-time customers in the first week, within a total advertising budget of Rs 2,100, and wants to know which channel worked so that next month's budget goes to the right place.

The campaign had to meet these requirements:

- A printed flyer with the business name, logo, contact details and one clear offer.
- A landing page that matches the flyer and is optimised for local search (keywords, meta tags, alt text, structured data).
- Google Analytics 4 on the page, tracking visits and the two actions that matter: claiming the offer and ordering on WhatsApp.
- A small Google Ads search campaign that sends people to the page.
- A way to tell flyer visitors apart from ad and social-media visitors.

Approach

Audience and keywords

The audience is office workers, college students and residents within about 5 km of RS Puram. Keyword research focused on local intent: *filter coffee coimbatore* (about 1,900 searches a month) and *filter coffee rs puram* became the main keywords, used in the page title, the H1 and the first ad group. Negative keywords such as *coffee powder* and *jobs* stop the ads showing to people who will never visit.

Flyer and landing page

The flyer carries one message, **20% off your first order** with code KAAPI20, and a QR code to the landing page. The page uses the same colours and offer, so someone who scans the code knows

they are in the right place. It has a 52-character title and a 145-character meta description that both contain the main keyword, one H1, alt text on every image, a canonical link and LocalBusiness structured data with the address and opening hours. A small script checks all of this; the page passes all 9 checks.

Tracking

Every channel has its own UTM link (flyer QR code, Google Ads, Instagram, WhatsApp status), so GA4 reports each one separately. The two buttons send GA4 events, *claim_offer_click* and *whatsapp_order_click*. The WhatsApp click is the key event, and it is imported into Google Ads as the campaign's conversion.

Google Ads

A search campaign within 5 km, Rs 300 a day for 7 days, Maximise Clicks with a Rs 12 maximum CPC, and ads shown only while the shop is open. Two descriptions were A/B tested with even rotation: one leading with the offer, one with the location.

Conclusion

In the first week the page had 711 users and 84 WhatsApp orders. The results by channel:

Channel	Sessions	WhatsApp orders	Order rate	Cost per order
Google Ads	455	38	8.4%	Rs 54
Flyer (QR code)	151	29	19.2%	printing only
Instagram	104	6	5.8%	-
WhatsApp status	70	11	15.7%	-

Google Ads brought the most visitors, but flyer visitors were more than twice as likely to order, because they were already nearby and holding the offer. All five requirements were met. For next month the recommendation is to keep the ads to the two best keywords, print a second run of flyers for the two colleges, and replace the Instagram post with WhatsApp status updates.

What I learned

Tracking has to be planned before the campaign starts: without its own UTM link, the flyer's visits would have looked like direct traffic and its success would have been invisible.

Limitations and possible improvements

- Seven days is too short for Google Ads to optimise; a 30-day test would give firmer numbers.
- A WhatsApp click is not a confirmed sale; counting the KAAPI20 code at the till would be.
- Asking first-week customers for Google reviews would help the shop show up in local map results.
